# Cedar: An Independent Reanalysis

Audit note | Fictional research fixture

### Same trial, different conclusion

This reanalysis examined the same 120 adults in the six-week Cedar trial. The audit identified a scoring error in the attention test.

### Corrected result

After correcting the scoring error, the Cedar sleep-extension group improved its attention score by 2 points, not 12 points. The control group also improved by 2 points. The reanalysis found no improvement in attention relative to the control group.

### What changed

The reanalysis agrees that nightly sleep increased to 7.5 hours. It disputes the attention-score result in the primary report. Both documents refer to the same participants, period, and attention test.

### Purpose of this document

This entire document is fictional. It exists to test whether an assistant preserves conflicting evidence instead of selecting only the most convenient source.
